

# UI Basics Demo

## App/Window States

1. Look at the dock and note which apps are open/running and which are not
2. Open a Keynote document and a Pages document. Note how the menu bar and each document window header changes when you click on one document window and then the other.
3. Drag one document window so that it partially occludes the other; repeat the exercise of clicking on document window and then the other
4. Open a second pages document window; click on the other document window that was already open; note how the Pages windows' headers change but the menu bar does not
5. Close both the Pages windows by clicking on the red dot in the windows' headers. Note that the menu bar and the doc indicate the Pages app is still open/running. Quit the pages app: File > Quit (or CMD+Q). Note how the menu bar and dock changes.

## Menu Bar

1. With several apps open, observe how the menu bar changes when you bring an app from the background to the foreground
2. Note how most menu items are literally verbs
  1. Some counterexamples
    1. [App] > Settings; [App] > About; Help
3. Keynote > File
  1. Note how there are some items in this menu with right pointing arrows beside them; these menu items open submenus
  2. Note how some items in the menu show their keyboard shortcuts
  3. Note how some items have an ellipsis after their name. This usually means those menu items open a dialog

## Cursors

1. Load [wikipedia.org](https://wikipedia.org) in a browser tab
  1. Note the insertion point cursor is present in the search textbox
  2. Note how the cursor changes shape when you hover over the search textbox and or the various language names
2. Load <https://www.yelp.com/map/m-sushi-durham> in a browser tab
  1. Note how the cursor changes when it is over the map
  2. Pan the map by pressing the (primary) mouse button noting how the cursor changes shape when I start to move the mouse

## Controls

1. Open the Safari app. Note that everything in the toolbar is a control!
2. Open the Keynote app, click File > Print (or CMD+P). In the print dialog that appears, there are examples of the following controls: button, checkbox, radio buttons, toggle, dropdown list, and combobox; there are also collapsibles on this dialog
  1. Instead of dismissing this dialog by clicking the "Cancel" button, tap the Esc key on the keyboard instead; the Esc key is a shortcut for the "Cancel" button in many/most dialogs

3.  > System Settings > Desktop & Dock. This settings panes contains two slider controls (labelled “Size” and “Magnification”).
4. Click this link to go to an Amazon page listing men’s dress shoes. Scroll down on the page until you see “Price” in the left hand column of the page. The control found here is slider control that allows you to constrain the range of prices in the list of shoes shown.
5. Open the Calendar app. At the bottom of the left hand side panel there is a date picker (i.e., the little month calendar view).
6.  > System Settings > Sounds. Scroll down to the “Output & Input” header. Note the buttons labeled “Output” & “Input” are radio controls; immediately beneath the “Output”/“Input” radio buttons is a listbox control. Note how the listbox changes when you click back and forth on the “Output” and “Input” buttons. Note how the controls beneath the listbox control change when you click on items in the listbox.
7. Load [this Amazon page](#) into your browser. Scroll down until the “Price” section is visible in the left-hand panel/sidebar. Note the slide seen there has two points that can be adjuster. This is another example of a slider control.
