

Demos: Passkeys & Password Managers

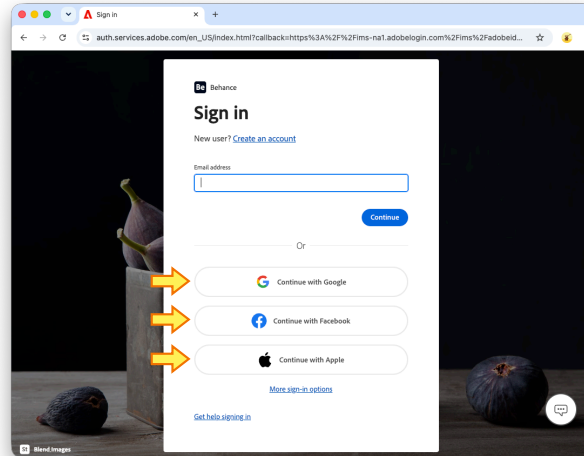

OLLI Digital Explorers SIG

David Shamlin September 2026

Demos

1. Social sign-in prompts
2. Chrome “asking” me if I want to use its built-in password manager
3. Adding a passkey to an account
4. Passwords app telling me it can sign-me in
5. Passwords app UI vs Bitwarden app UI
6. Authenticator apps

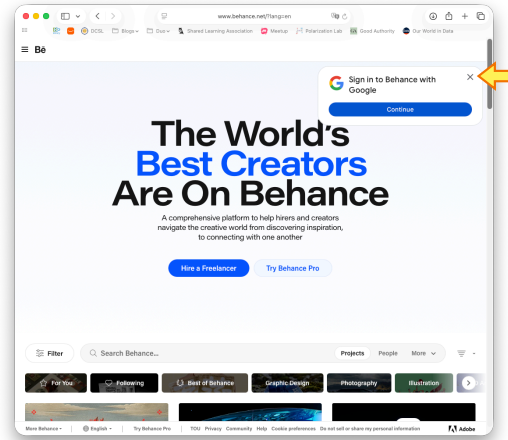

Demo 1: Social Sign-in

Behance is a social networking site for creative professionals (e.g., graphic designers, illustrators, animators, etc). The screen capture shows the dialog presented when you click the “Sign in” link on the site’s main page. The yellow arrows point to buttons for social sign-in. I.e., if you were to click on one of those buttons, then...

- If you already signed in to your account the site named on the button, you will be immediately signed into Behance
- If you aren’t already signed in, you will see the sign-in window for the site named on the button you clicked. You then sign-in using your credentials for that other site (e.g., Google, Facebook, or Apple). Once you have successfully done that, you are signed into Behance

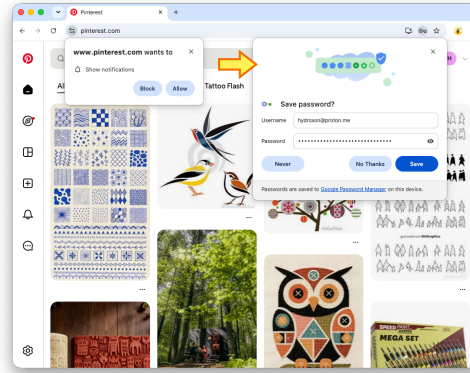

Demo 1: Social Sign-in

To generate the above screenshot, I went to the Behance website using **Safari**. I do not have an account with this website, and I am not on the site's sign-in page.

The yellow arrow is pointing to a dialog **from the site**. It is another social sign-in prompt. If I clicked the “Continue” button, I would automatically be signed into the Behance site if I was also already signed into Google in my Safari browser. If I were not already signed into Google in my Safari browser, I would be prompted to enter my Google credentials. Once I had done that, I would then be signed into the Behance site.

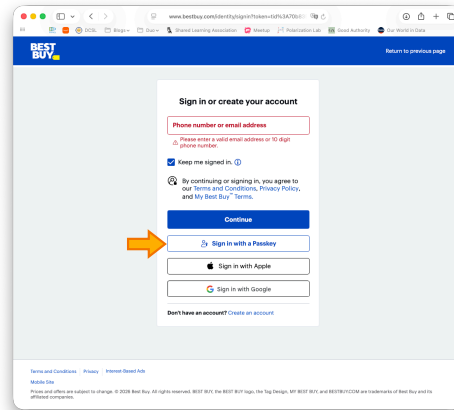

Demo 2: Built-in Browser Password Manager

For this example, I used Chrome. After signing in to Pinterest, Chrome immediately put the dialog box the yellow arrow points to.

If I clicked on the Save button in this dialog box, Chrome would turn on its built-in password manager and save my Pinterest id & password in its vault. Chrome's built-in password manager will stay on after I close the window and/or quit Chrome; from then on when I used Chrome and sign in to any site, it will save my credentials for that site in its vault.

Demo 3: Adding a passkey to an account

Given that passkeys are relatively new in the digital world, sites that support passkeys have to provide the people that have existing accounts a way to add a passkey to their account. In my experience using passkeys, there are two (slightly different) ways sites are doing that:

1. On the site's account settings page that allows you to do things like change your password and/or turn 2FA on/off, there is also a button or link that allows you to add a passkey to your account.
2. On the site's sign-in page, there is a button or a link you can click/tap that adds a passkey to the account as you sign-in.

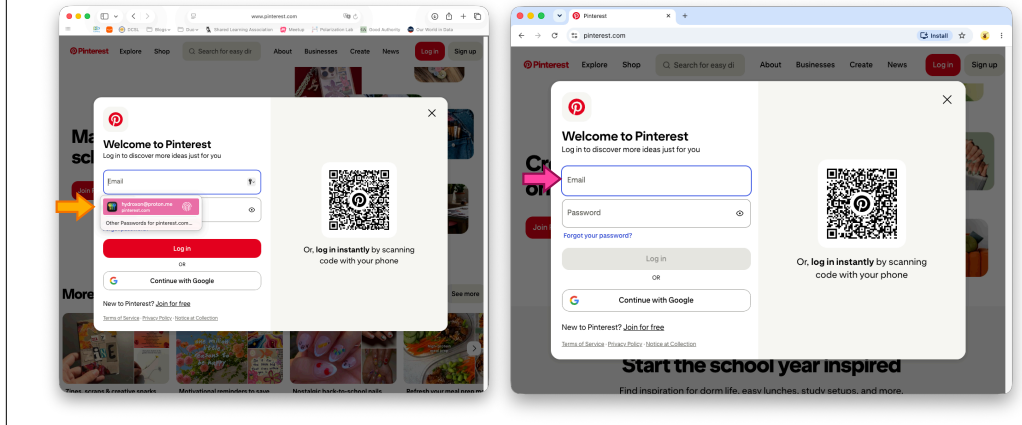

The image above shows BestBuy's sign-in page. The yellow arrow points to the button I can click/tap to add a passkey to my account as I sign-in. I decided to use BestBuy's site for this example because of the words on this button. Every other site I have seen that supports passkeys and has a link/button like this on its sign-in page uses the verbs "create" or "add"; BestBuy's sign-in page is the first one I've seen that uses the verb "sign-in" with these buttons/links. Admittedly that seems like a fairly subtle difference, but in the digital world such subtleties can sometimes be confusing/misleading. I had such a moment when I initially looked at this page. I first thought the site was essentially asking me if I wanted to use my id and password or my

previously created passkey to sign in. That made me wonder what the site would do if I clicked that button before if I had not previously created a passkey for my BestBuy account? For complete transparency, I don't actually have a BestBuy account, so I haven't clicked/tapped the "Sign in with a Passkey" button to learn what happens. I suspect the site will both create/add a passkey to my account and sign me in. And what I do know (because I have clicked/tapped buttons/links like this I've encounter on other site's sign-in pages) is that it's absolutely possible that I won't have to do anything else beside tap/click that button for the site to create a passkey, send it to my password manager's vault, and sign me in. It's that easy! Which is great! And its all done in the blink of an eye—literally; it only takes nanoseconds. Which might be not so great at times.

I can think of technical reasons why a site might not be able to create/add a passkey to my vault that "magically." Both the password manager and browser am I using when I create/add a passkey to my account may prevent the site from doing all the steps involved in creating/adding a passkey to a vault by itself. I may have to do some additional things myself, or the site may "throw up its hands" and say "No can do, buckaroo."

Which leads me to the key point I wanted to convey with this demo case: If you chose to use a password manager for the first time, you are very likely to going to encounter situations that "stump" or surprise you. Be patient with yourself; remind yourself your are learning and doing at the same time; be prepared to spend some additional time before you click these "create/add a passkey" links and buttons. And ask for help.

Demo 4: Passwords app telling me it can sign-me in

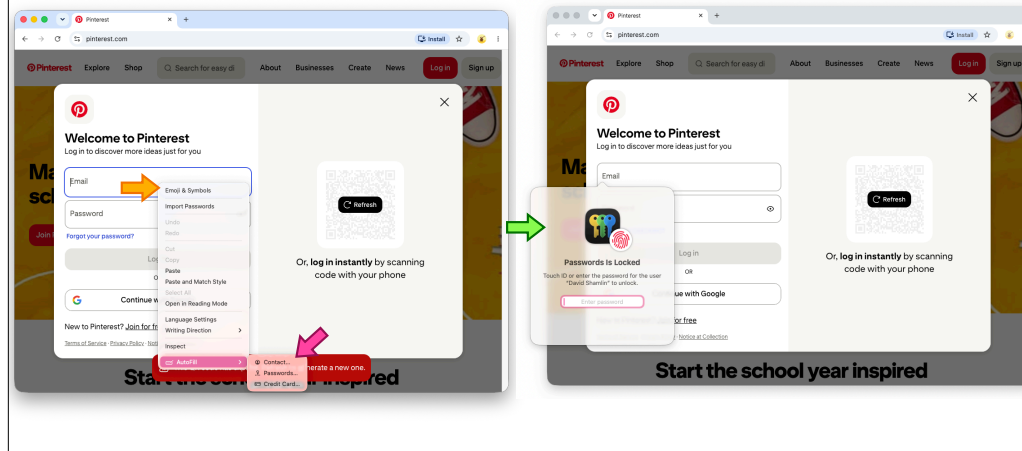

The image above on the right is a **Safari** browser window. The image above on the left is a **Chrome** browser window.

In both those windows, I navigated to Pinterest's sign-in dialog.

In the Safari window, I then clicked on the Email text box and the dialog box the yellow arrow is pointing to appeared. This dialog box is being put on the screen by Apple's Passwords app; note that the icon in on the right hand side of the dialog looks exactly like the Passwords app icon.

In the Chrome window, I also clicked on the Email text box, however no dialog appeared.

Demo 4: Passwords app telling me it can sign-me in

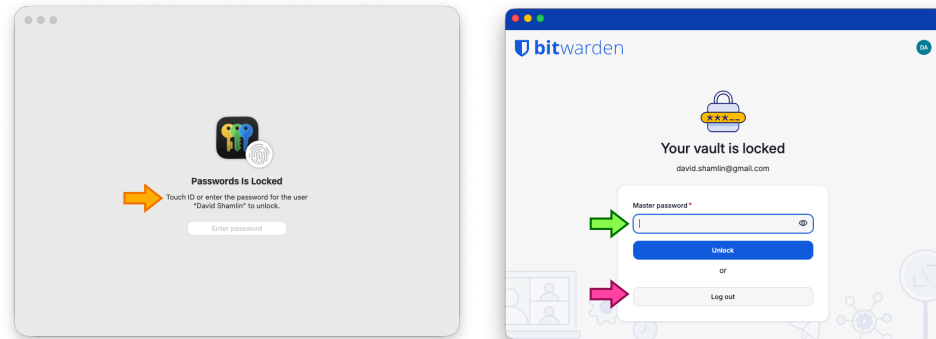

Continuing with the example from the previous page and still using **Chrome**.

If I **double**-click on the Email text box, the pop-up menu pointed to by the yellow arrow appears.

If I move the mouse cursor down that pop-up menu until it is over the “Autofill” item, then the popup menu pointed to by the pink arrow appears. If I then click on the “Passwords...” item, the dialog pointed to by the green arrows appears.

Note that this dialog also shows an icon that matches the Passwords app icon. If I touch the biometric key on my computer’s keyboard or type in my computer’s password into the textbox on that popup, the credentials I have stored in the Password’s app will then be put in the associated fields on the sign-in dialog. If I then click on the “Log in” button, I will be signed in to Pinterest.

Demo 5: Passwords app UI vs Bitwarden app UI

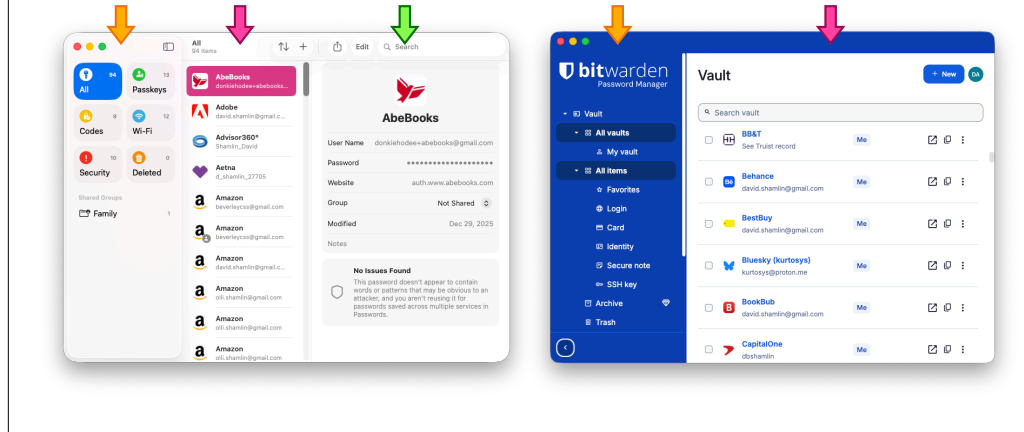

When you launch a password manager app, the initial window prompts you to unlock its vault.

The image on the left shows that window in the Passwords app. You unlock the vault by typing in the same password you type when you log into your computer or you use your device's biometric feature if you have it enabled.

The image on the right shows that window in the Bitwarden app. You unlock the vault by typing in the “master password” in the similarly labeled text box (green arrow) that you created when you used Bitwarden the first time. Note the “Log out” button pointed to by the pink arrow. If you use a third-party password manager app—i.e., a password manager app that was not already on your device when you purchased it—you will have to create an account on the company's website in order for that password manager app's sync feature to work. The logout button in this window signs you out of that account when you click it.

Demo 5: Passwords app UI vs Bitwarden app UI

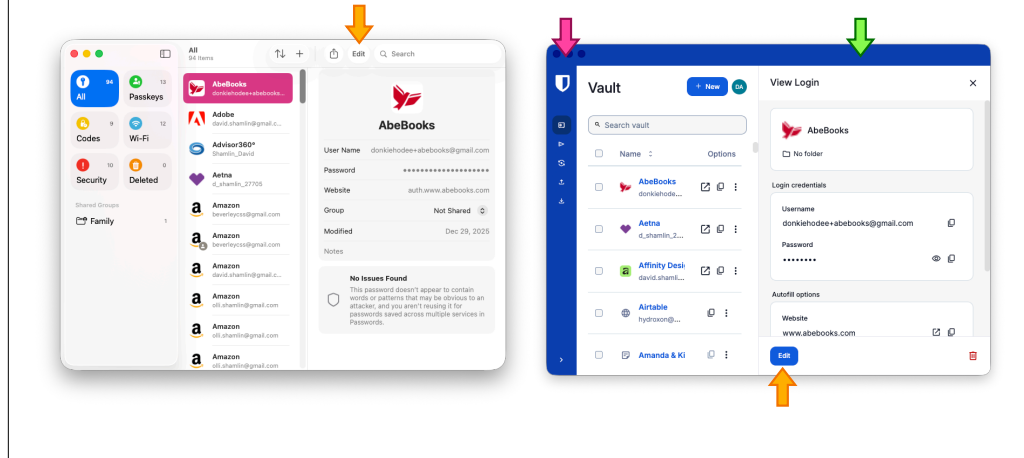

The images above show each password manager's window after I have unlocked their vaults. The Passwords app is on the left and the Bitwarden app is on the right.

The two yellow arrows are pointing to UI panes often called “navigation bars”, “navigation menus”, and “navigation panels”. The two red arrows are pointing to UI panes that show all the accounts I have added to each password manager's vault. I can scroll this pane up and down when there are more accounts than can be shown on the screen at the same time. The green arrow is showing me the detailed information stored in my Passwords app's vault for the account that is highlighted (in pink) in middle pane.

To see Bitwarden's version of the same thing, I have to click on the name of account first. The images on the next page show that Bitwarden pane.

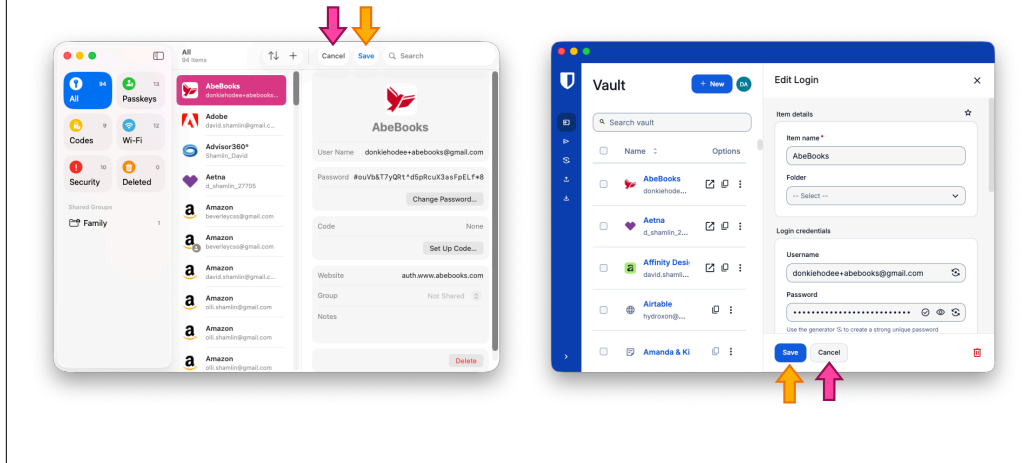

Demo 5: Passwords app UI vs Bitwarden app UI

The image on the right shows the Bitwarden app screen after I have clicked the name of an account in that app. The green arrow is pointing to the area of the Bitwarden window that shows the detail information for the account I selected. The other thing that changed in the Bitwarden window is the width of its navigation menu (pink arrow).

If I need to change any of the account details I have stored either of these password manager apps, I click/tap the Edit button in that app. (Pointed to by the yellow arrows.). The next page shows what each password manager looks like after I have clicked those buttons.

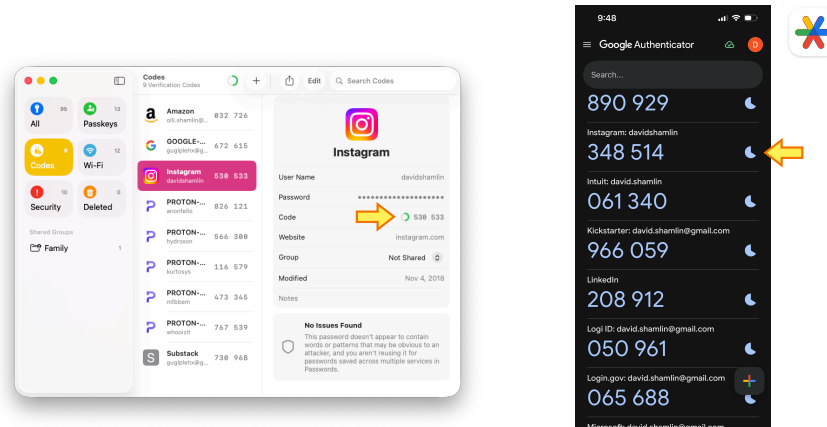

Demo 5: Passwords app UI vs Bitwarden app UI

The images above show each of the password manager apps in “edit mode”. “Edit mode” allows you to change the information about an account I have stored in a password manager.

Once I have made changes, I need to click/tap the “Save” button (yellow arrows). If I change my mind and don’t want the changes I made to be saved to the password manager’s vault, I can click the “Cancel” button instead (pink buttons).

Demo 6: Authenticator Apps

The Passwords app has an authenticator built in; Bitwarden does not. If you chose to use a password manager app that doesn't have a built in authenticator, you can use a separate app in tandem with your password manager app. The image on the right is an example of that kind of app.

The yellow arrows are pointing to the code that I type into the site page. Note that beside each of these codes there is also a little round icon. (In the Passwords app screenshot, that circle is half grey and half green; in the authenticator app screenshot is blue—with a “slice cut out of it”.) These circles are “countdown timers”. Recall that these codes have “expiration dates”. These circles are showing you how much time you have before the codes expire. As soon as a code expires, the authenticator will immediately show you a new code. So you don't need to rush to enter a code if there are only a few seconds left on its timer; just wait a few seconds to see the next code.
